Heterocyclic Chemistry • Joule J.A. & Mills K. PDF

This chapter focuses on five-membered heterocyclic compounds, and discusses their possible structures, nomenclature, properties, and tautomerism. The simplest nitrogen heterocyclic analogue of the aromatic cyclopentadiene anion is pyrrole, while the corresponding oxygen and sulfur analogues are furan and thiophene.

Heterocyclic compounds may be classified into three types: (i) Five Membered, (ii) Six Membered and (iii) Fused or Condensed Heterocyclic compounds. Five-membered heterocyclic compounds bearing one more heteroatom The five membered membered heterocyclic compounds containing one heteroatom is shown in the figure4.

An Introduction to Heterocyclic Chemistry

Enables researchers to fully realize the potential to discover new pharmaceuticals among heterocyclic compounds Integrating heterocyclic chemistry and drug discovery, this innovative text enables readers to understand how and why these two fields go hand in hand in the effective practice of medicinal chemistry.

Heterocyclic chemistry is the branch of chemistry dealing with the synthesis, properties, and applications of heterocycles. Heterocyclic derivatives, seen as a group, can be divided into two broad areas:

Gilchrist, T. L. Heterocyclic Chemistry; Longman; London, 1992) The standard method for naming heterocyclic rings is the Hantzsch-Widman nomenclature system. A heterocycle is a ring containing at least one atom that is not carbon: "hetero" means "different." Nitrogen, oxygen, and sulfur are the primary elements seen in common heterocycles.

Another facet of heterocyclic chemistry was disclosed in the course of investigations concerning the action of thiamine (following diagram). As its pyrophosphate derivative, thiamine is a coenzyme for several biochemical reactions, notably decarboxylations of pyruvic acid to acetaldehyde and acetoin.

Heterocyclic chemistry is the branch of organic chemistry dealing with the synthesis, properties, and applications of these heterocycles. [9] Examples of heterocyclic compounds include all of the nucleic acids, the majority of drugs, most biomass (cellulose and related materials), and many natural and synthetic dyes.
